EDUCATION

JADAVPUR UNIVERSITY

BACHELOR OF ENGINEERING, INFORMATION
TECHNOLOGY

June 2020 | Kolkata, India

CGPA: 7 / 10

CALCUTTA PUBLIC SCHOOL

HIGH SCHOOL

May 2016 | Kolkata, India

95.3%

SKILLS

BACKEND

Typescript - Node.js - NestJS - gRPC - Golang -
Python

DATABASES

PostgreSQL - MongoDB - Redis - Elasticsearch -
ClickHouse

DEVOPS

Docker - Kubernetes - Grafana - Loki - Jenkins

TOOLS

Kafka - Redis - Nginx - Jest

EXPERIENCE

CONVOSIGHT | SOCIAL INTELLIGENCE | SENIOR SOFTWARE ENGINEER

March 2025 - July 2026

- Led Persona, an agentic platform that turns a target demographic into an interviewable entity expanding the demographic definition, researching it against real social content, and distilling it into a persona that brand managers can query to test claims, ads, and messaging.
- Owned backend architecture for Persona as IC while directing 1 FE and 1 QA engineer in partnership with the PM.
- Built Aria, a LangGraph agent for social research, which screens the query, decomposes complex asks into sub-questions, selects filters and calls internal MCP tools to retrieve matching posts and comments, then surfaces its retrieval plan for human approval before executing and synthesizing the answer.
- Established Aria's evaluation loop to measure answer quality. Used structured internal review feedback over a month of testing, and 50+ analyst-written real client reports as reference answers for this.
- Built social data ingestion across Reddit, X, Instagram, TikTok, and YouTube comments via official APIs, Apify and Phyllo providers, and a Chrome extension for TikTok where no API access existed. Ingested and indexed around 2 million posts in Elastic.
- Built daily brand-crisis detection over Elasticsearch, which uses brand keywords to check indexed posts, filters for negative-sentiment terms, and routes results to an LLM classifier for severity scoring and false-positive suppression.
- Instrumented end-to-end distributed tracing across microservices with OpenTelemetry, and built Grafana dashboards for API errors, token consumption, and LLM spend, giving the team per-feature cost attribution as agent usage grew over time.

DHAN YOJANA | ALGO TRADING PLATFORM | CORE ENGINEER

July 2024 - February 2025

- Built real-time tick processing path in Go, ingesting broker feed ticks, persisting to TimescaleDB, updating live candlestick, and driving active-trades with p99 around 1.2ms.
- Designed risk engine to determine position sizing, drawdown limits, price-spike guards, and a kill switch that closes all positions or opens offsetting positions with a secondary broker when an order freezes on the primary.
- Built a backtesting engine, modeling slippage and fees, with performance visualization metrics.

RAILOFY | TRAVEL INSURANCE TECH | SDE 2

February 2022 - June 2024

- Built a resilient stateless PNR status pipeline scraping 10K+ daily records from an upstream rail portal using headless browser automation with distributed IP rotation and using Tesseract OCR.
- Built event-driven WhatsApp and email delivery on Kafka, fronted by a dedicated idempotency service, eliminating duplicate notifications on consumer retries.
- Cut p50 latency by 65% across core services through eager cache reads and composite indexes on long-running queries.
- Migrated train service (schedules, coach composition) and PNR tracking service from Node.js to Golang, doubling throughput.

SPEAKX | AI ENGLISH SPEAKING APP | FULLSTACK DEVELOPER

August 2020 - January 2022

- Automated video ingest from Dropbox via it's API, queueing transfers to S3 with retry and idempotency handling to survive partial failures and duplicate events.
- Triggered a transcoding pipeline on S3 upload events to produce 360p/480p/720p/1080p renditions, letting the player step down quality on poor connections instead of buffering.
- Developed an Instagram reels like feed for content delivery, driving engagement up by around 40%
